Performance Analysis of Refined Induction Motor Models Considering Iron Loss

Wan Jun Yin\textsuperscript{1,2} and Tao Wen\textsuperscript{1,*}

Abstract—In the applications such as induction motor efficiency optimization and electric vehicle speed control, the influence of the iron loss cannot be ignored. In order to improve the running efficiency of induction motor, the ordinary differential equations (ODE) and difference equations (DE) of induction motors considering iron loss have been established. The results show that the proposed refined ordinary differential equations and difference equations of induction motors considering iron loss and its simulation models are believable, and simulated and experiment results have demonstrated that the models perform well.

1. INTRODUCTION

Among various types of AC motors, induction motors, especially squirrel cage motors, are most commonly used in industry due to their economy, reliability, and durability. However, the research on the establishment and control of motor model is often considered ideal, without considering the iron loss. In practice, iron loss resistance is a function of frequency, and the equivalent magnetization reactance is also a variable value and a function of main magnetic flux [1, 2]. In order to control it accurately, it is necessary to study the simulation of motor control considering the actual situation. Although the development of variable frequency speed regulation technology has greatly reduced the losses of induction motors, the problem of low light load operation efficiency still exists. Today, energy problem is becoming more and more serious. It is of great significance to study the energy saving problem of variable frequency speed regulating induction motor under light load and improve its operation efficiency for saving energy and controlling environmental pollution. The mathematical models of ordinary differential equation and difference equation of induction motor considering the effect of equivalent resistance of iron loss are established.

Because the states and parameters are separated clearly in the ODE representation of the induction motor mathematical model, establishing a parameter variable simulation model is very easy [3–7], and the parameter can be changed during the simulation in arbitrary form.

2. ODE AND DE OF INDUCTION MOTORS CONSIDERING IRON LOSS

2.1. ODE of Induction Motors Considering Iron Loss

The equivalent Circuit of Induction Motor Considering Iron Loss under $dq$ Axis of Synchronous Rotating Coordinate System is shown in Fig. 1.
Based on Fig. 1 according to the Kirchhoff’s law, the voltage equations and current equations of the iron loss equivalent branch are as follows.

\[
\begin{align*}
L_m \frac{di_{dm}}{dt} - \omega_e L_m i_{qm} &= i_{dFe} R_{Fe} \\
L_m \frac{di_{qm}}{dt} + \omega_e L_m i_{dm} &= i_{qFe} R_{Fe} \\
i_{ds} + i_{dF} &= i_{dm} + i_{dFe} \\
i_{qs} + i_{qF} &= i_{qm} + i_{qFe}
\end{align*}
\]

(1)

the stator side and rotor side voltage equations are given as follows.

\[
\begin{align*}
R_s i_{ds} - \omega_e L_{ls} i_{qs} + L_{ls} \frac{di_{ds}}{dt} + i_{dFe} R_{Fe} &= u_{ds} \\
R_s i_{qs} - \omega_e L_{ls} i_{qs} + L_{ls} \frac{di_{qs}}{dt} + i_{qFe} R_{Fe} &= u_{qs} \\
R_r i_{dr} - \omega_e L_{sr} i_{qr} + L_{sr} \frac{di_{dr}}{dt} + L_m \frac{di_{dm}}{dt} - \omega_e L_m i_{qm} + \omega_r \psi_{dr} &= 0 \\
R_r i_{qr} - \omega_e L_{sr} i_{qr} + L_{sr} \frac{di_{qr}}{dt} + L_m \frac{di_{qm}}{dt} + \omega_e L_m i_{dm} + \omega_r \psi_{dr} &= 0
\end{align*}
\]

where \(i_{ds}\) and \(i_{qs}\) are the \(d\)-axis and \(q\)-axis stator currents; \(R_{Fe}\) is the equivalent iron loss resistance; \(\omega_e\) is the power angle frequency; \(\omega_r\) is the rotor electrical angular frequency; \(i_{dm}\) and \(i_{qm}\) are the \(d\)-axis and \(q\)-axis magnetizing currents, \(A\); \(u_{ds}\) and \(u_{qs}\) are the \(d\)-axis and \(q\)-axis stator voltages; \(\psi_{dr}\) and \(\psi_{qr}\) are the \(d\)-axis and \(q\)-axis rotor flux linkages; \(L_{ls}\) is the stator leakage inductance; \(L_{sr}\) is the rotor leakage inductances; \(L_m\) is the mutual inductance; \(R_s\) is the stator resistance; \(R_r\) is the rotor resistance.

ODE of the induction motor considering the iron loss is as follows.

\[
\begin{align*}
- \frac{(R_s + R_{Fe}) i_{ds}}{L_{ls}} + \omega_e i_{qs} + \frac{L_r R_{Fe} i_{dm}}{L_{ls} L_{sr}} - \frac{R_{Fe} \psi_{dr} + u_{ds}}{L_{ls}} &= \frac{di_{ds}}{dt} \\
- \omega_e i_{ds} - \frac{(R_s + R_{Fe}) i_{qs}}{L_{ls}} + \frac{L_r R_{Fe} i_{qm}}{L_{ls} L_{sr}} - \frac{R_{Fe} \psi_{dr} + u_{qs}}{L_{ls}} &= \frac{di_{qs}}{dt} \\
\frac{R_{Fe} i_{qs}}{L_{ls}} - \omega_e i_{dm} - \frac{L_r R_{Fe} i_{qm}}{L_{ls} L_{sr}} + \frac{R_{Fe} \psi_{dr}}{L_{ls}} &= \frac{di_{dm}}{dt} \\
\frac{L_m R_r i_{dm}}{L_{sr}} - \frac{(L_m R_r + R_r) \psi_{dr} + (\omega_e - \omega_r) \psi_{dr}}{L_{sr}} &= \frac{d\psi_{dr}}{dt} \\
\frac{L_m R_r i_{qm}}{L_{sr}} - \frac{(L_m R_r + R_r) \psi_{qr} + (\omega_e - \omega_r) \psi_{dr}}{L_{sr}} &= \frac{d\psi_{qr}}{dt}
\end{align*}
\]

(3)
where \( T \) is established.

where \( L_s \) is the stator inductance, \( L_r \) the rotor inductances, \( T_L \) the load torque, \( P \) the number of pole pairs, and \( J \) the inertia moment.

### 2.2. DE of Induction Motors Considering Iron Loss

Similarly, the difference equations can be obtained from ordinary differential equations

\[
\begin{align*}
    i_{ds}(k+1) &= \left( 1 - \frac{(R_s - R_{Fe})T}{L_{\sigma s}} \right) i_{ds}(k) + T_\omega(k) i_{qs}(k) + \frac{T u_{ds}(k)}{L_{\sigma s}} + \frac{L_r R_{Fe} T_{i_{dm}(k)}}{L_{\sigma s} L_{\sigma r}} - \frac{R_{Fe} T}{L_{\sigma s} L_{\sigma r}} \psi_{dr}(k) \\
    i_{qs}(k+1) &= \left( 1 - \frac{(R_s - R_{Fe})T}{L_{\sigma s}} \right) i_{qs}(k) - T_\omega(k) i_{ds}(k) + \frac{T u_{qs}(k)}{L_{\sigma s}} + \frac{L_r R_{Fe} T_{i_{qm}(k)}}{L_{\sigma s} L_{\sigma r}} - \frac{R_{Fe} T}{L_{\sigma s} L_{\sigma r}} \psi_{qr}(k) \\
    i_{dm}(k+1) &= \left( 1 - \frac{L_r R_{Fe} T}{L_{m} L_{\sigma s}} \right) i_{dm}(k) + T_\omega(k) i_{qm}(k) + \frac{R_{Fe} T_{i_{ds}(k)}}{L_{m}} - \frac{R_{Fe} T}{L_{m} L_{\sigma r}} \psi_{dr}(k) \\
    i_{qm}(k+1) &= \left( 1 - \frac{L_r R_{Fe} T}{L_{m} L_{\sigma s}} \right) i_{qm}(k) - T_\omega(k) i_{dm}(k) + \frac{R_{Fe} T_{i_{qs}(k)}}{L_{m}} - \frac{R_{Fe} T}{L_{m} L_{\sigma r}} \psi_{qr}(k) \\
    \psi_{dr}(k+1) &= \left[ 1 - T \left( \frac{L_{m} R_r}{L_{r} L_{\sigma r}} + \frac{R_r}{L_r} \right) \right] \psi_{dr}(k) + \frac{L_{m} R_r T_{i_{dm}(k)}}{L_{\sigma r}} + T(\omega_e(k) - \omega_r(k)) \psi_{qr}(k) \\
    \psi_{qr}(k+1) &= \left[ 1 - T \left( \frac{L_{m} R_r}{L_{r} L_{\sigma r}} + \frac{R_r}{L_r} \right) \right] \psi_{qr}(k) + \frac{L_{m} R_r T_{i_{qm}(k)}}{L_{\sigma r}} - T(\omega_e(k) - \omega_r(k)) \psi_{dr}(k)
\end{align*}
\]

where \( T \) is the sampling period. The torque equation and motion equation are as follows

\[
\begin{align*}
    T_e(k) &= \frac{P L_m}{L_{\sigma r}} (i_{qm}(k) \psi_{dr}(k) - i_{dm}(k) \psi_{qr}(k)) \\
    \omega_r(k+1) &= (T_e(k) - T_L(k)) \frac{P T}{J} + \omega_r(k)
\end{align*}
\]

### 3. BUILDING SIMULATION MODEL IN MATLAB

Matlab is very popular simulation softwares in the power electronics fields [4–11]. In order to verify the correctness of the induction motor model considering iron loss, a simulation model as shown in Fig. 2 is established.

![Simulation model of induction motor considering iron loss](image-url)
The simulation key C code is as follows:

\[
\begin{align*}
A_{11} &= -(R_s + R_f) / L_s; \\
A_{13} &= (L_r R_f) / (L_s L_r); \\
A_{15} &= R_f / (L_s L_r); \\
A_{33} &= -(L_r R_f) / (L_m L_r); \\
A_{35} &= R_f / (L_m L_r); \\
A_{53} &= (L_m R_r) / L_r; \\
A_{55} &= -(L_m R_r) / (L_r L_l) + (R_r / L_r); \\
x_1 &= i_{ds} + (A_{11} i_{ds} + W_e i_{qs} + A_{13} i_{dm} + A_{15} \Psi_{idr} + U_d / L_s) \Delta t; \\
x_2 &= i_{qs} + (A_{11} i_{qs} - W_e i_{ds} + A_{13} i_{qm} + A_{15} \Psi_{iqr} + U_q / L_s) \Delta t; \\
x_3 &= i_{dm} + ((R_f / L_m) i_{ds} + A_{33} i_{dm} + W_e i_{qm} + A_{35} \Psi_{idr}) \Delta t; \\
x_4 &= i_{qm} + ((R_f / L_m) i_{qs} + A_{33} i_{qm} - W_e i_{dm} + A_{35} \Psi_{iqr}) \Delta t; \\
x_5 &= \Psi_{idr} + (A_{53} i_{dm} + A_{55} \Psi_{idr} + (W_e - W_r) \Psi_{iqr}) \Delta t; \\
x_6 &= \Psi_{iqr} + (A_{53} i_{qm} + A_{55} \Psi_{iqr} + -(W_e - W_r)) \Psi_{idr}) \Delta t; \\
ids &= x_1, iqs = x_2, idm = x_3, iqm = x_4, Psiidr = x_5, Psiqr = x_6; \\
Te &= ((pm L_m) / LIR) * (iqm * psiidr - idm * psiqr); \\
W_r &= W_r + (((Te-TL)*pm)/J)*\Delta t \\
n &= 30 * W_r / (pm*3.1415926); 
\end{align*}
\]

4. MODEL VALIDATION

In order to verify the correctness of the proposed user-defined simulation models established, the models are compared with the library model provided by Matlab, and an induction motor is employed in the experiments. The parameters are given in Table 1.

**Table 1.** Induction motor parameters comparison.

Figure 3 gives the comparison results between the actual operation data and the proposed model simulation curves. The actual induction motor is driven by an inverter employing the variable voltage variable frequency (VVVF) operation mode. The frequency command rises from 0 Hz to 50 Hz within 2 s, and the induction motor runs at no load. It can be seen that the proposed models can give nearly fair numerical analog for the actual induction motor. The correctness and validity of the model are further verified.
Figure 3. Comparison between numerical solution of proposed simulation model and actual operation data of induction motor. (a) Speed wave forms. (b) Current wave forms comparison when induction motor starts. (c) Current wave forms comparison at steady state.

5. CONCLUSION

In this paper, the ordinary differential equation and difference equation models of induction motor considering iron loss are established and compared with MATLAB motor simulation model. The simulation results verify the accuracy of the model.

In future work, we will explore a simpler and more accurate induction motor model for the purpose of improving the operation efficiency of the motor.
